ENDOMETRIAL POLYP
Uterine Polyp

The finger like overgrowths attached to the inner wall of the uterus that extend into the uterine cavity which are made of endometrial tissue

Related Diagnoses:
- Endometrial cancer
- Oligomenorrhea
- Bilateral fallopian tube blockage
- Unilateral fallopian tube blockage

About Endometrial polyp

Endometrial polyps are benign localized lesions of the endometrium, which are commonly seen in women of reproductive age. Some may be precancerous or cancerous. They usually occur in women in their 40s and are rare in women under 20 years of age.

The main difference between uterine polyps and uterine fibroids is that fibroids are composed of muscle tissue and polyps are made of endometrial tissue.

No definitive cause of endometrial polyps is known, but they appear to be affected by hormone levels and grow in response to circulating estrogen. Risk factors include obesity, high blood pressure and a history of cervical polyps. Taking tamoxifen or hormone replacement therapy can also increase the risk of uterine polyps.

Endometrial polyps can be solitary or occur with others. They are round or oval and measure between a few millimeters and several centimeters in diameter. They are usually the same red/brown color of the surrounding endometrium although large ones can appear to be a darker red. The polyps consist of dense, fibrous tissue (stroma), blood vessels and gland-like spaces lined with endometrial epithelium. If they are pedunculated, they are attached by a thin stalk (pedicle). If they are sessile, they are connected by a flat base to the uterine wall. Pedunculated polyps are more common than sessile ones.

Endometrial polyps can be detected by vaginal ultrasound (sonohysterosgraphy), hysteroscopy and dilation and curettage. Detection by ultrasonography can be difficult, particularly when there is endometrial hyperplasia (excessive thickening of the endometrium).

Although treatments such as hysteroscopy usually cure the polyp concerned, recurrence of endometrial polyps is frequent. Untreated, small polyps may regress on their own.

Associated disease
- Infertility
- Uterine polyps can be associated with malignancy (particularly in older, postmenopausal women)

Complications

Endometrial polyps are usually benign although some may be precancerous or cancerous. About 0.5% of endometrial polyps contain adenocarcinoma cells.

Risk factors
- Being perimenopausal or postmenopausal
- High blood pressure (hypertension)
- Obesity
- Taking tamoxifen, a drug for breast cancer
- History of cervical polyps

Impact on fertility

It is believed that endometrial polyps may have an adverse effect on fertility and fertility treatment outcome. The specific reason that polyps affect fertility is unknown, but polyps may create an inflammatory reaction inside the uterine cavity or cause irregular bleeding at the time of implantation. These effects would create a hostile environment for the implanting embryo and possibly prevent pregnancy or potentially cause miscarriages.

Prevention

There is no way to prevent uterine polyps but endometrial resection proved effective in preventing their recurrence.

Symptoms

They often cause no symptoms. Where they occur, symptoms include irregular menstrual bleeding, bleeding between menstrual periods, excessively heavy menstrual bleeding (menorrhagia), and vaginal bleeding after menopause. Bleeding from the blood vessels of the polyp contributes to an increase of blood loss during menstruation and blood "spotting" between menstrual periods, or after menopause. If the polyp protrudes through the cervix into the vagina, pain (dysmenorrhea) may result.

Therapies

Self therapy

Alternative therapies such as naturopathic medicine may help in shrinking the size of polyps.

Conventional medicine

Pharmacotherapy

Certain hormonal medications, including progestins and gonadotropin-releasing hormone agonists, may lessen symptoms of the polyp.

Surgical therapy

Endometrial polyps can be surgically removed using curettage with (polypectomy) or without hysteroscopy. When curettage is performed without hysteroscopy, polyps
may be missed. To reduce this risk, the uterus can be first explored using grasping forceps at the beginning of the curettage procedure. Hysteroscopy involves visualising the endometrium (inner lining of the uterus) and polyp with a camera inserted through the cervix. If it is a large polyp, it can be cut into sections before each section is removed. If cancerous cells are discovered, a hysterectomy (surgical removal of the uterus) may be performed. A hysterectomy would usually not be considered if cancer has been ruled out. Whichever method is used, polyps are usually treated under general anesthetic.

However, surgical resection of endometrial polyps is recommended in infertile patients prior to treatment in order to increase natural conception or assisted reproductive pregnancy rates.

Assisted reproduction

Polyps can increase the risk of miscarriage in women undergoing IVF treatment. If they develop near the fallopian tubes, they may lead to difficulty in becoming pregnant. There is mixed evidence regarding the resection of newly diagnosed endometrial polyps during ovarian stimulation to improve the outcomes of fresh in vitro fertilization cycles.

Diagnoses

Fallopian tube blockage
An obstruction prevents the egg or sperm from traveling down the tube, thus making fertilization impossible.
Learn more at: www.fertilitypedia.org/therap/diag/fallopian-tube-blockage

Endometrial cancer
Cancer that arises from the endometrium, the lining of the uterus.
Learn more at: www.fertilitypedia.org/therap/diag/endoemetrial-cancer

Oligomenorrhea
Light or infrequent menstrual flow at intervals of 39 days or 6–7 cycles in a year.
Learn more at: www.fertilitypedia.org/therap/diag/oligomenorrhea

Bilateral fallopian tube blockage
A blockage of both fallopian tubes.
Learn more at: www.fertilitypedia.org/therap/diag/bilateral-fallopian-tube-blockage

Unilateral fallopian tube blockage
A condition of blocked passage through one of the Fallopian tubes.
Learn more at: www.fertilitypedia.org/therap/diag/unilateral-fallopian-tube-blockage

Organs

Fallopian tubes
Two very fine tubes that transport sperm toward the egg, and allow passage of the fertilized egg back to the uterus for implantation.
Learn more at: www.fertilitypedia.org/edu/organs/fallopian-tubes

Uterus
The uterus is the largest and major organ of the female reproductive tract that is the site of fetal growth and is hormonally responsive.
Learn more at: www.fertilitypedia.org/edu/organs/uterus

Reproductive cells

Endometrial cell
Cells composing an inner layer of the uterine lining.
Learn more at: www.fertilitypedia.org/edu/reproductive-cells/endometrial-cell

Endometrial mucosa
A membrane that forms the upper layer of endometrium that lines uterine cavity, in which fertilized eggs are implanted.
Learn more at: www.fertilitypedia.org/edu/reproductive-cells/endometrial-mucosa
Endometrium
The innermost layer of uterus forming the uterine lumen where the implantation of an ovum occurs.
Learn more at: www.fertiltyandfertility.org/edu/reproductive-system/endometrium

Biological control

Estrogen
The primary female sex hormone responsible for the development and regulation of the female reproductive system and secondary sex characteristics.
Learn more at: www.fertiltyandfertility.org/edu/biological-control/estrogen

Reproductive functions

Implantation
The very early stage of pregnancy at which the embryo adheres to the wall of the uterus.
Learn more at: www.fertiltyandfertility.org/edu/reproductive-functions/implantation

Risk factors

Cervical polyp
Small, elongated tumors that grow on the cervix and that are the most common cause of intermenstrual vaginal bleeding.
Learn more at: www.fertiltyandfertility.org/edu/risks/cervical-polyp

Hypertension
An elevated blood pressure, clinically defined as at or greater than 140/90 (systolic/diastolic) mmHg.
Learn more at: www.fertiltyandfertility.org/edu/risks/hypertension

Miscarriage
Intrauterine death of an embryo or a fetus of less than 500g in mass or before 20 weeks of gestation.
Learn more at: www.fertiltyandfertility.org/edu/risks/miscarriage

Obesity
A medical condition of excess body fat that can have a negative effect on health, leading to reduced life expectancy and other health problems.
Learn more at: www.fertiltyandfertility.org/edu/risks/obesity

Perimenopause
The period directly preceding and then directly following menopause, usually beginning at a mean age of 45.5–47.5 years.
Learn more at: www.fertiltyandfertility.org/edu/risks/perimenopause

Postmenopause
The period in a woman’s life following her last menstrual period, characterised by permanent infertility.
Learn more at: www.fertiltyandfertility.org/edu/risks/postmenopause

Symptoms

Heavy or prolonged bleeding in menstrual period
Abnormally heavy or prolonged bleeding in menstrual periods.
Learn more at: www.fertiltyandfertility.org/edu/symptoms/heavy-or-prolonged-bleeding-in-menstrual-period

Infertility
The failure to achieve a clinical pregnancy after 12 months or more of regular unprotected sexual intercourse.
Learn more at: www.fertiltyandfertility.org/edu/symptoms/infertility

Infrequent menstruation
The medical term for infrequent, often light menstrual periods (intervals exceeding 35 days).
Learn more at: www.fertiltyandfertility.org/edu/symptoms/infrequent-menstruation

Irregular bleeding between the menstrual periods
Bleeding that occurs irregularly between the menstrual period.
Learn more at: www.fertiltyandfertility.org/edu/symptoms/irregular-bleeding-between-the-menstrual-periods

Irregular menstruation
Irregular menstruation is a menstrual disorder whose manifestations include irregular cycle lengths as well as metrorrhagia
Learn more at: www.fertiltyandfertility.org/edu/symptoms/irregular-menstruation

Painful menstruation
Dysmenorrhea is a pain during menstruation. It is the most common menstrual disorder.
Learn more at: www.fertiltyandfertility.org/edu/symptoms/painful-menstruation

Vaginal bleeding
Irregular intermenstrual bleeding including postcoital bleeding.
Learn more at: www.fertiltyandfertility.org/edu/symptoms/vaginal-bleeding

Therapies

Dilation and curettage
A procedure performed to remove the uterine lining or other tissues in the uterine cavity, for either diagnostic or therapeutic purposes.
Learn more at: www.fertiltyandfertility.org/edu/therapies/dilation-and-curettage

Egg donation
Process by which a woman donates eggs for purposes of assisted reproduction or biomedical research.
Learn more at: www.fertiltyandfertility.org/edu/therapies/egg-donation

Hysterectomy
Surgical removal of the uterus.
Learn more at: www.fertiltyandfertility.org/edu/therapies/hysterectomy
ICSI
A micromanipulative fertilization technique in which a single sperm is injected directly into an egg.
Learn more at: [www.fertilxpedia.org/esi/therapies/icsi](http://www.fertilxpedia.org/esi/therapies/icsi)

Polypectomy
Surgical treatment of removal of endometrial polyps preserving the uterus.
Learn more at: [www.fertilxpedia.org/esi/therapies/polypectomy](http://www.fertilxpedia.org/esi/therapies/polypectomy)

Sperm donation
The procedure in which a non (sperm donor) provides his sperm for fertility treatment.
Learn more at: [www.fertilxpedia.org/esi/therapies/sperm-donation](http://www.fertilxpedia.org/esi/therapies/sperm-donation)

Standard IVF
A process in which an egg is fertilised by sperm outside the body: in vitro. Owns or donated gametes may be used.
Learn more at: [www.fertilxpedia.org/esi/therapies/standard-ivf](http://www.fertilxpedia.org/esi/therapies/standard-ivf)
